

SKOVSAGER GROUP

**ONE WORLD
ONE SUPPLIER**

Welcome to an experienced business partner

The Skovsager Group is family owned and has its headquarters in Denmark. Our business is on a sound financial footing; consequently, we have always been a leader when it comes to new technologies, constantly investing substantial sums in machinery to consolidate our leading position.

The Skovsager Group comprises highly specialised companies, each with its own key areas of expertise. The Group comprises the following companies:

QuickTube A/S, a business partner with unique know-how and experience in the field of production optimisation using advanced 3D laser tube cutting, and

NMF Industries, which has extensive experience in engineering and high-tech sheet processing. NMF Industries has companies in Denmark, China and the US, all with Danish management. That is why NMF Industries is geared to deliver the best solution, whether for stand-alone development tasks or large-scale batch runs.

When you choose the Skovsager Group, you are also choosing a supplier and business partner equipped to see your entire project through, from start to finish. Our key task is to tailor an optimised production flow for your particular project, ensuring that quality, delivery and competitive prices combine to maximise the value for your supply chain.

One point of entry

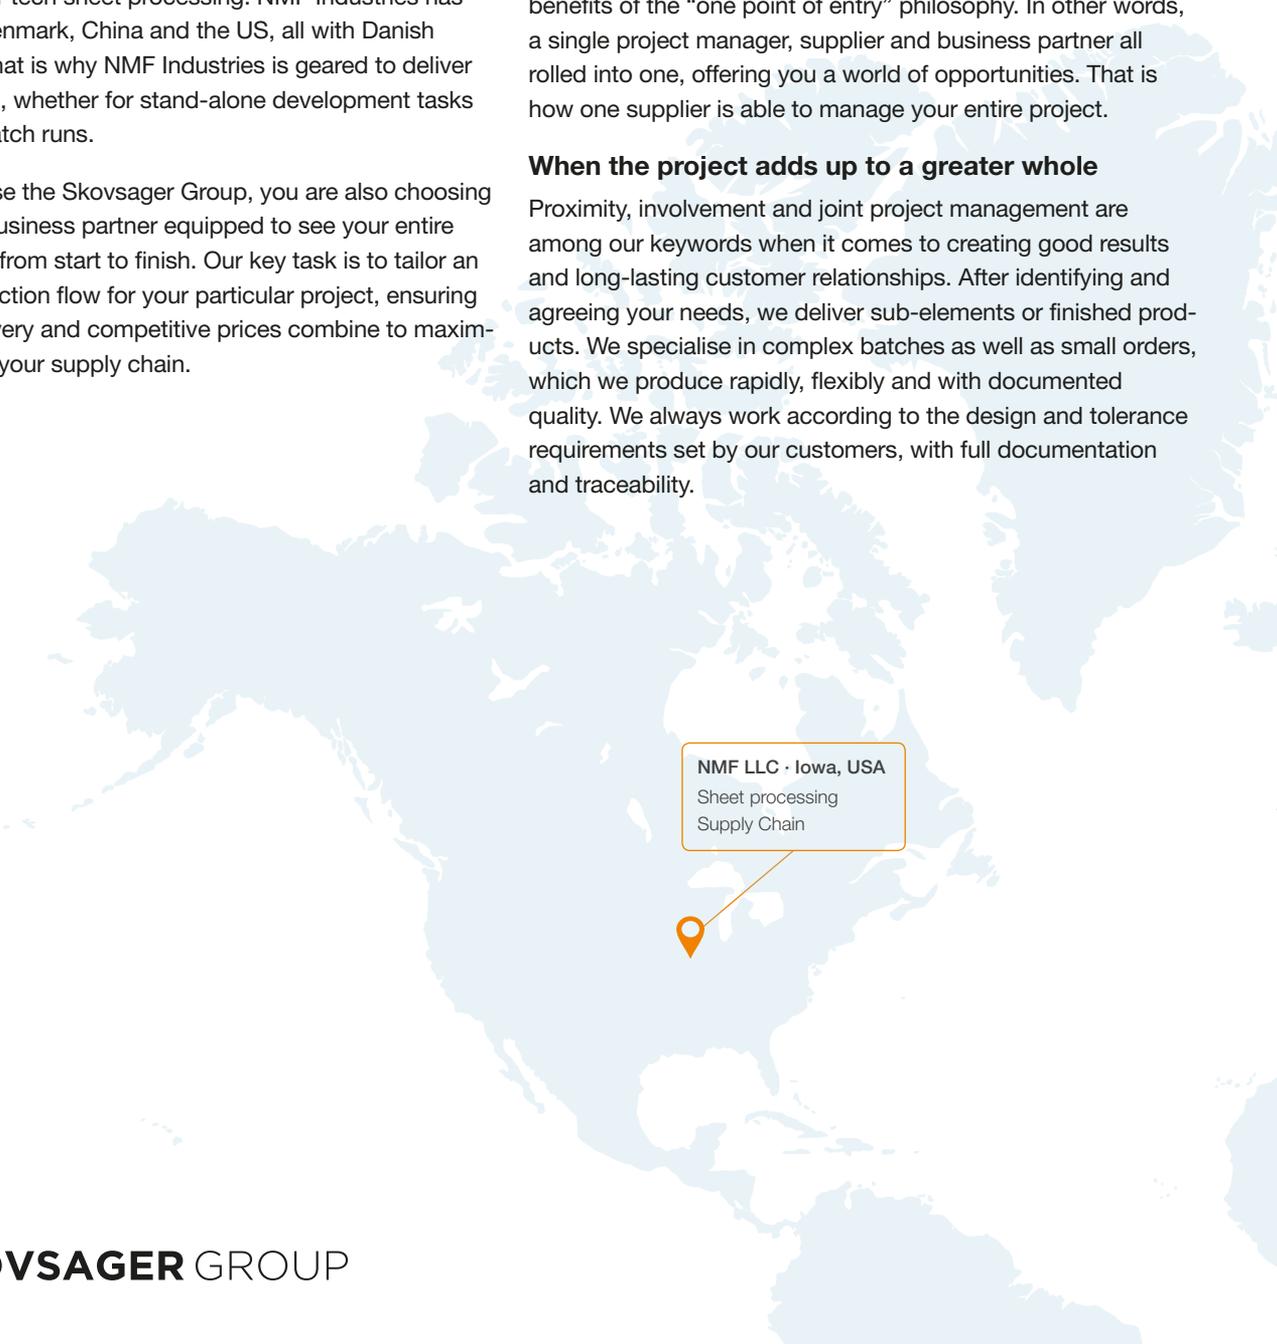

The Skovsager Group provides a reliable hinterland of capable, experienced suppliers working together to carry your projects through to the best and financially most profitable outcome for you. This could be via our own companies in Denmark, China and the US, or via one of our specialised external business partners. This means we are always able to offer our customers the best possible combination of quality, price and delivery terms.

This network of individual companies and business partners puts you in the strongest position when it comes to know-how about and working with steel and aluminium.

We emphasise combining our expertise to bring you all the benefits of the “one point of entry” philosophy. In other words, a single project manager, supplier and business partner all rolled into one, offering you a world of opportunities. That is how one supplier is able to manage your entire project.

When the project adds up to a greater whole

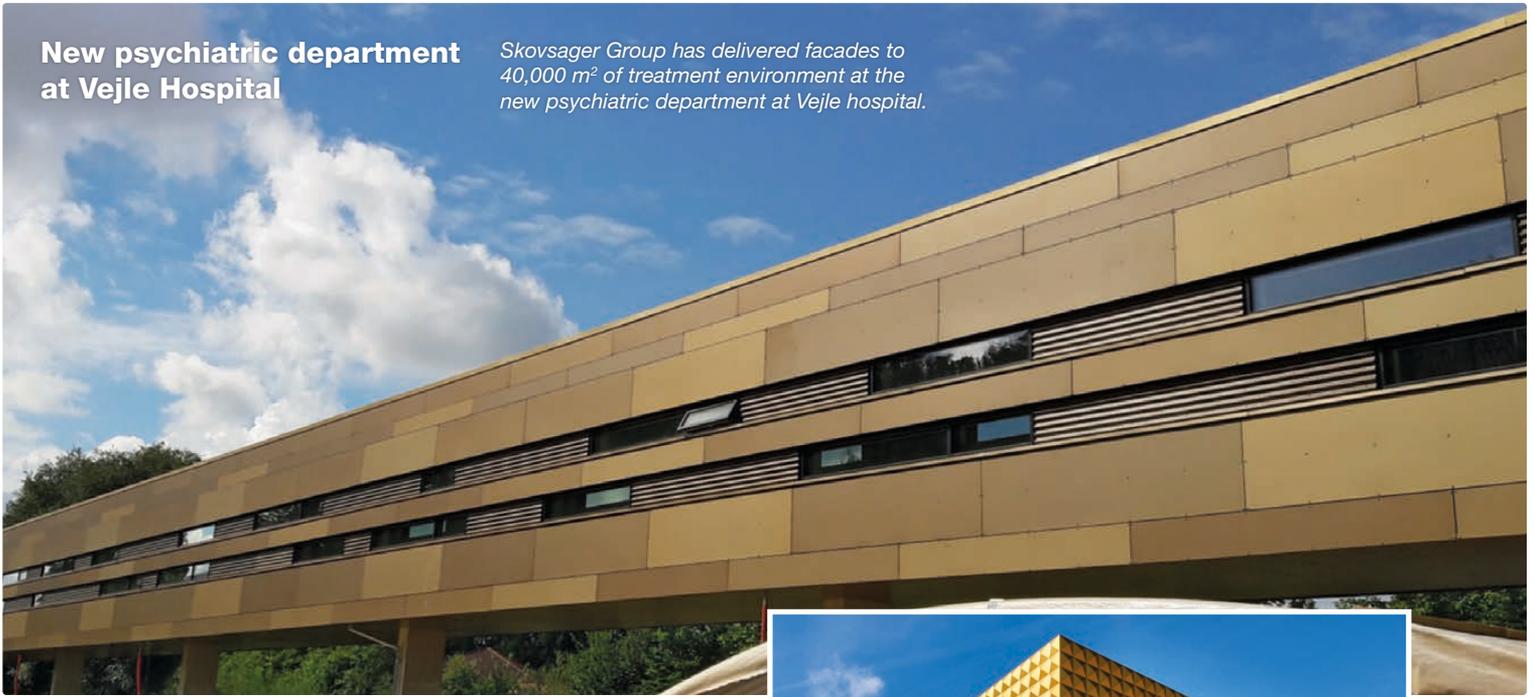

Proximity, involvement and joint project management are among our keywords when it comes to creating good results and long-lasting customer relationships. After identifying and agreeing your needs, we deliver sub-elements or finished products. We specialise in complex batches as well as small orders, which we produce rapidly, flexibly and with documented quality. We always work according to the design and tolerance requirements set by our customers, with full documentation and traceability.

Engineering | The well-thought-out project

Our engineers and technicians are standing by to advise and innovate, working with your team. Together, we develop and implement well-thought-out projects, tailored to your needs. It doesn't matter whether it's day-to-day technical support or major, complex projects.

We incorporate 3D engineering, cost-reduction, manufacturing maturation and tool optimisation into how we envisage the project – and the sooner we get involved in a project, the better able we are to steer the task through to a satisfactory conclusion. The Skovsager Group makes a positive contribution to

your project, no matter whether you bring us in right from the concept stage or whether you involve us in projects requiring further work.

Among us, you will find technically proficient employees who bring a great deal of knowledge to your project in the fields of sheet processing of aluminium and steel, design, choice of materials, production processes and assembly. Combined with efficient, precision production, you will find us to be a professional, stable external supplier that infuses your project with maximum value.

Projekt flow

Possible solutions

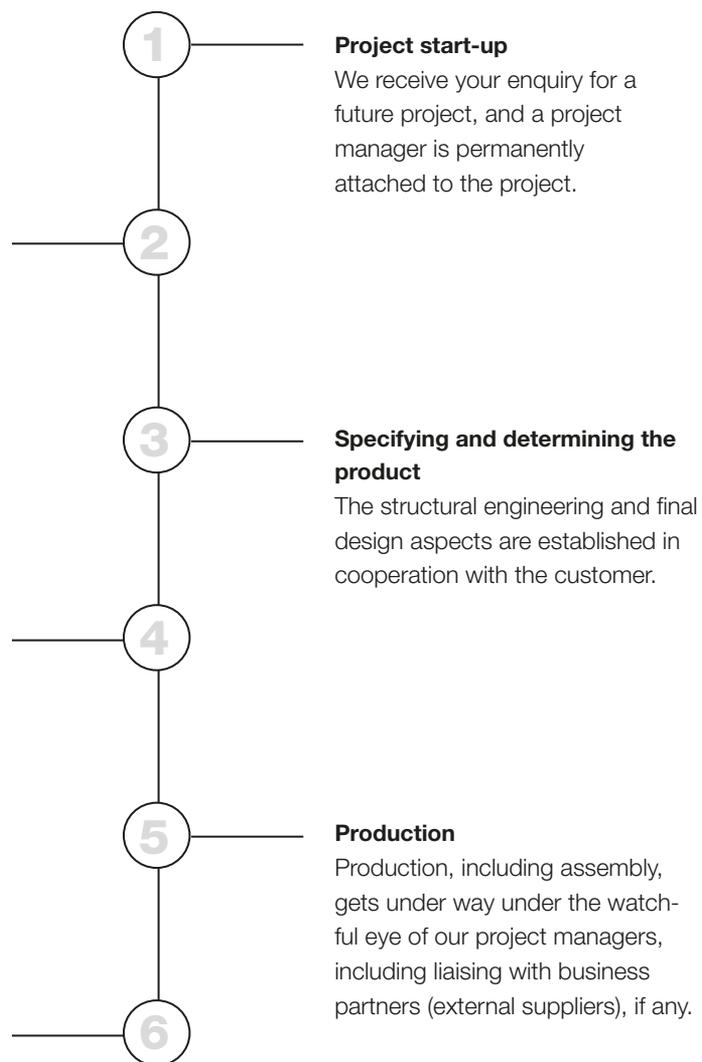

We work with the customer to identify and develop concepts for the opportunities and challenges of the project. As part of this, we may become involved in the development and design of individual products.

Production preparations

We establish production methods and logistics and, if relevant, enter into agreements with business partners (external suppliers), and begin preparing the production process. Documentation requirements are established.

Delivery

Your finished project is delivered on time and at the agreed quality. If relevant, stocking of the product is agreed so that the products are delivered in accordance with a specified delivery plan.

Sheet processing

High-tech quality

NMF Industries is the Skovsager Group's specialist in high-tech sheet processing using all types of metals for the manufacturing industry and the construction sector. We have access to an advanced array of machinery for laser cutting, punching using both eccentric presses and CNC-controlled revolving punching, as well as folding using various types of press brakes. Our machinery thus includes all types of state-of-the-art tools, welding systems, etc., for efficient machining of steel, stainless steel and aluminium, and we are of course certified to carry out our own NDT. We are constantly updating our machinery, and in 2017 we invested in an 8 KW fibre laser cutting machine. It is one of the fastest fibre laser cutting machines in the market, serving to boost our capacity still further. It has an impressive cutting speed; it is far more eco-friendly than CO2 laser cutters and allows for working with steel, aluminium, stainless steel, copper and brass.

We specialise in mass production, and, at our own factory in China, we are also geared for international tasks involving both large and small batch production, and at very favourable prices. Our US set-up gives us the capability to finish and stock products for delivery to the US market.

At NMF Industries, we always endeavour to deliver consistently high quality within the desired delivery time. Quality, documentation and traceability come naturally to us as part and parcel of being a supplier to even the most demanding industries.

Our sites in Denmark and China are both certified to ISO 9001:2008 and EN1090-1 EXC3, endorsing the effectiveness of our quality management and internal processes.

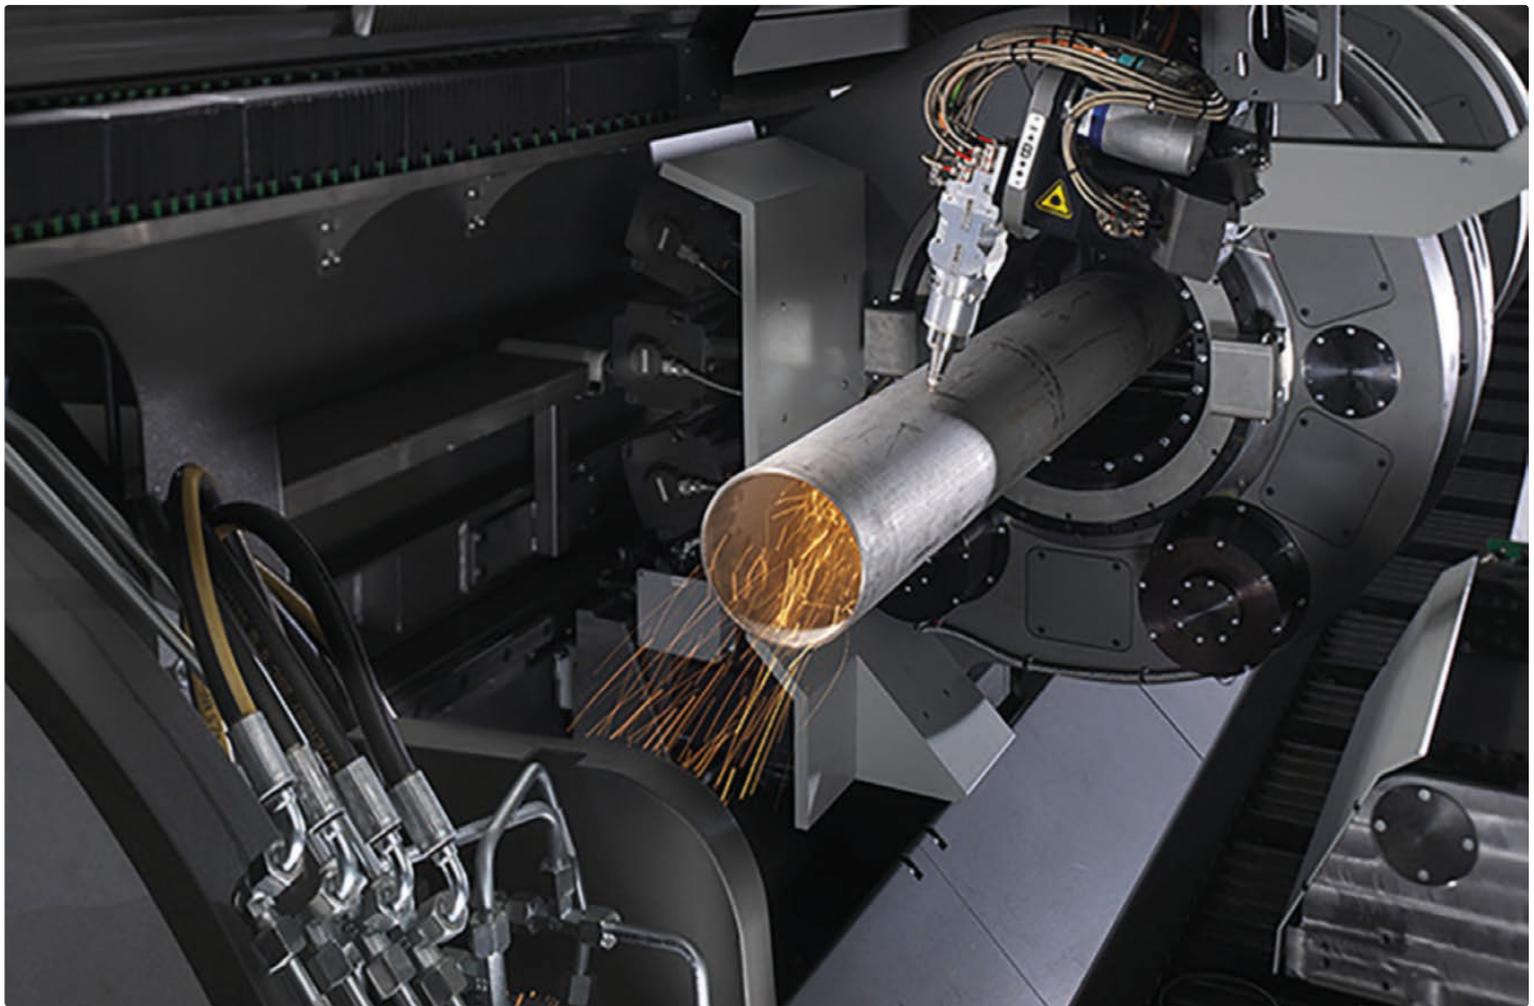

In addition to these certifications, many years of collaborating with the biggest names in the wind turbine industry have demonstrated our ability to adapt to ever-stricter requirements.

Today, we deliver to many different industries, including:

- The wind power industry
- The offshore industry
- The engineering sector
- The automotive and aircraft industry
- The construction industry
- Façade solutions

Laser tube cutting

The entire operation in a single work process

Savings of up to 30% on normal hours spent on a number of workshop tasks – does that sound too good to be true?

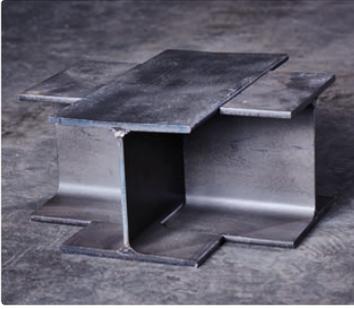

QuickTube is the Skovsager Group's experienced specialist in conventional laser tube cutting as well as in advanced 3D laser tube cutting. 3D laser tube cutting achieves unique uniformity and precision, to provide an efficient manufacturing flow in the finish work – generating great savings in your own production process.

QuickTube knows that 3D laser tube cutting is the way to work with steel and aluminium, going forward. Using the latest 3D laser-cutting technology, we make, in one operation, a number of cost-increasing operations unnecessary, such as drilling, sawing, milling, countersunk chamfering and punching.

We've made delivering quality easy

When we deliver the parts for large frames and structures, we have many years' experience of building user-friendliness and efficiency into the project. We engrave ID numbers on the individual parts, making assembly straightforward for the welders. Dovetail solutions ensure robust, efficient assembly of sheet and tube components, sometimes supported by engraved instructions. It doesn't get easier than that!

QuickTube A/S delivers in accordance with EN1090-1 with the associated traceability and documentation. We are also putting the finishing touches to certification to ISO 9001:2015, with certification expected by June 2017.

The largest 3D laser cutter in northern Europe

Thanks to our recent investment in one of the largest laser cutters in northern Europe, we are now able to offer customers utterly unique options that transcend what used to be the bounds of dimensioning when it comes to 3D laser tube cutting. We are able to cut the large workpieces for your project at our own factory, and then ship them to the construction sites, where the tailor-made elements can be readily assembled according to your particular requirements. That saves you valuable time on various adaptations of tubes and profiles on the construction site and in the welding booth.

The sooner you involve us in your project, the more your architects, clients and contractors will be able to benefit from our expertise and experience, working with us to identify the very best solution.

Our new laser cutter is a fibre laser cutting machine, so it is also suitable for cutting copper and brass. With the array of machinery now at our disposal, therefore, the possibilities are virtually infinite.

Profile machining using 3D laser cutting

QuickTube is one of only suppliers in Denmark which can carry out profile machining using 3D laser cutting. We can machine angles, U-profiles, IPE and HEB beams, oval holes, joints, dovetail solutions and much more. In fact, we can work with angles of up to 150 x 150 x 16 mm. Traditionally, profiles are machined on drilling and sawing equipment, a labour-intensive process with a high risk of fluctuations in dimensions and radius. With laser cutting you get uniquely accurate holes and cutouts every time, and a shorter production time.

Minimum welding time: Balcony attached within one hour

“Five to nine hours.” This was how long a number of experienced balcony manufacturers estimated it would take to attach our balcony. The right answer was less than one hour!

We cut our balconies on our laser tube cutter and design them to minimise welding time. The balcony is designed with holes prepared for galvanisation of inflow and outflow.

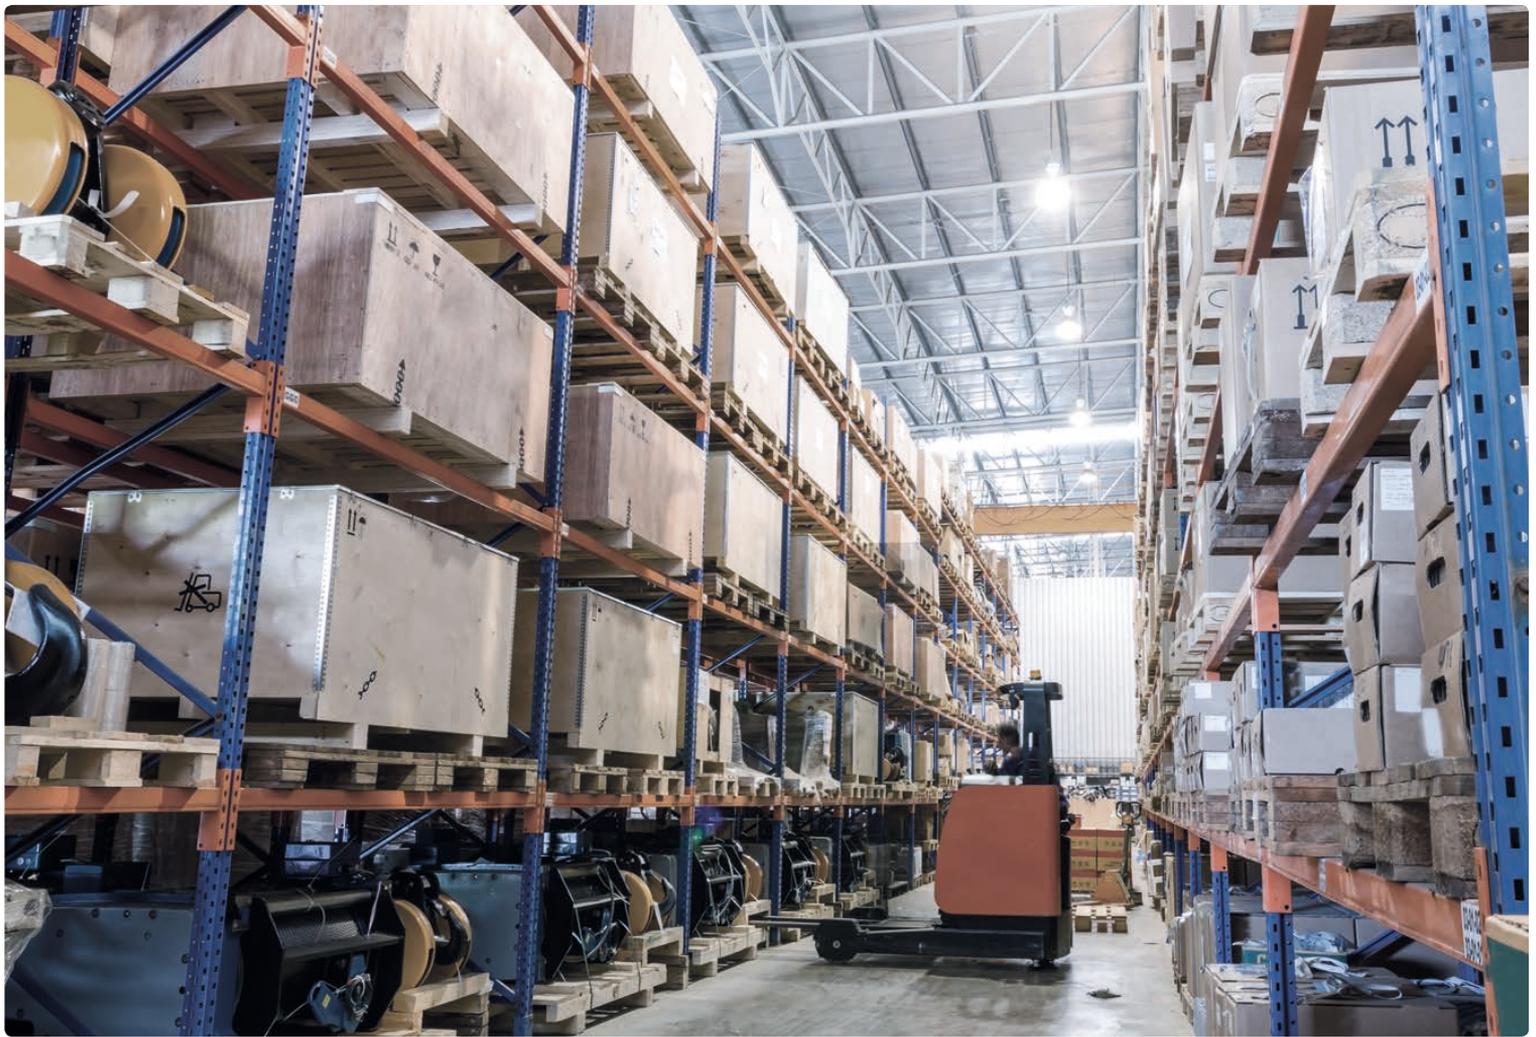

Punching | Tolerances and finish

QuickTube is your knowledgeable business partner with extensive experience of punching small single-piece batches as well as large-scale batch runs. Our focus is always on small tolerances and an attractive finish for every single piece.

For strategic reasons, punching is part of the QuickTube range of services, as this area perfectly complements the rest of QuickTube's workflow and know-how.

We place high value on developing and investing in our array of machinery; accordingly, we are always at the leading edge, technologically. From our customers' point of view, this makes us highly competitive in terms of quality and manufacturing costs. We are able to deliver your order packed and partially assembled as per your instructions, and of course we also offer all kinds of post-processing of the punched workpieces, either in-house or using close associates. Our punching department has facilities for shearing, die-cutting and deburring workpieces of all sizes.

Supply Chain

Maximum flexibility from warehouse to delivery

Our production and supply chain match our customers' requirements in every way. That's because we understand the importance of delivering quality, on time and at the agreed price. Our entire supply chain matches these expectations, guaranteeing you maximum flexibility all the way through.

Many Skovsager Group customers also benefit greatly from our provision of stocking raw materials, other materials,

pre-produced and ready-made workpieces. We deliver to our customers from these stores at agreed frequencies, with agreed quantities dispatched to the address where the customer needs to get to further process these workpieces. We offer global warehousing in our own facilities in Denmark, China and the US, or via business partners in other countries. This way, we are able to guarantee that your goods will be ready on time and in the right place.
